

Notes

A corkboard of coloured sticky notes with real text formatting

⚠ FOR UNDERSTANDING PURPOSES ONLY

Corkboard

Six colours

Rich text

Delete

1. The Idea

Notes works like a real sticky-note board: short coloured cards, each with a title and some text, laid out in two columns and each tilted very slightly. Notes are shown newest first and saved on the phone.

2. What One Note Holds

- A **title** (optional) and the note **text**.
- Which of **six pastel colours** it uses — yellow, pink, blue, green, orange or purple. Only the colour's position in the palette is stored, so every note stays consistent even if the exact shades are tweaked later.
- Which words are **bold**, **italic**, **underlined** or **struck-through**.
- When it was created and when it was last edited.

3. Screens

Screen	What it does
Notes board	Shows every note as a card. Tap a card to edit; the small “x” deletes after a confirmation popup; the Add button creates a new note. The footer jumps to other sections
New Note	A form with a title, a body with a formatting toolbar (Bold, Italic, Underline, Strikethrough, bullet list) and a row of colour swatches. The body must not be empty. Save Note or Cancel
Edit Note	A full-page editor with the same toolbar and colours; Save at the bottom and Delete in the top bar. Editing never resets the original creation date, only the “last edited” time

Add and Edit never write to storage themselves. They report what the person chose, and the board applies it on screen and saves it.

4. Clever Bits

Text stored in styled “runs”

Imagine “Buy milk and eggs” with only “milk” in bold. Instead of one sentence plus a list of “bold letters 5 to 9”, the note is split into three chunks — “Buy ”, “milk”, “ and eggs” — and each chunk remembers its own formatting. Joining the chunks always gives back the exact sentence. A plain unformatted copy is also kept for quick jobs such as estimating card height or checking whether a note is empty.

A shorter-column-first layout

The two columns are balanced by keeping a running height estimate for each (a base height, plus the title length, plus half the body length) and always adding the next note to whichever column is currently shorter.

A tilt that stays put

Each card’s slight tilt is calculated from the note’s own ID rather than chosen randomly, so a note keeps the same angle every time the screen redraws instead of jittering.
