Encrypted backup

Excel

PDF

Merge / Replace

1. Four Kinds of Output

Output	Made by	Purpose
Encrypted backup file (.vault)	Home → Export	A complete, password-locked copy of what you choose, restorable on this or a new phone
Excel workbook	Family list, each dashboard, Rolodex	Readable, multi-tab reports for sharing or analysis
CSV file	Daily Log dashboard	A spreadsheet-ready table
PDF	Invoices; Daily Log monthly receipt	Printable documents

Every export ends in the phone's normal **Share menu** (email, WhatsApp, Drive, print...) or a Save to Device option.

2. The Encrypted Backup

The backup can contain someone's entire financial life — account numbers, policy numbers, Stash secrets. Saved as plain text, anyone who found the file could read all of it. So it is **locked with a password you choose**, using strong encryption, and the app adds protection of its own on top, so a generic “unlock this kind of file” tool is not enough on its own.

There is no password recovery — by design

A forgotten backup password cannot be reset. A spare, easier side door would defeat the whole point of having a password. The app says so before the backup is created.

Step 1 — Choose what goes in

A checklist screen appears first. Everything is ticked by default; **Select All / Deselect All** in the top bar flips every switch at once.

Category	How it is chosen
Deposits, Insurance, Post Office, Mutual Fund	Per family member — for example Dad’s deposits in, Mom’s left out
Notes · Rolodex · Saved Invoices · Certificates	Simple on / off switches
Stash	Two independent switches: the cards , and separately the lock that guards them
Daily Log	Three independent switches: Events Reminder, Payment Schedule, Expenses & Dues

Step 2 — Password, then Save or Share

After choosing, you set the backup password, a progress message shows while the file is built, and you pick **Save to Device** or **Share**.

3. Importing a Backup

A wizard restores data from one or more backup files — useful on a new phone, or to add data from another backup without losing what you have.

1. **Pick** one or more files. Anything that isn’t a genuine DepoVaultTick backup is skipped immediately, before a password is even requested.
2. **Password**. One password is tried against every file first (usually all your backups share one). Any file that doesn’t open gets its own prompt afterwards.
3. **Mode**. Choose how to combine the data (below).
4. **Confirm** and finish.

Mode	What it does
Merge (recommended)	Keeps everything already in the app, adds anything new from the file(s), and flags anything that exists in both places with different details for you to review
Replace	Wipes the app’s current data and loads exactly what is in the file(s). Asks for an extra confirmation because it cannot be undone

4. Reviewing Conflicts

If a merge finds something present in both places but not matching — say an “HDFC Bank — Fixed Deposit #123” that now shows a different amount or maturity date — a review screen shows the two versions side by side. For each, choose:

- **Keep Mine** — ignore the imported version.

- **Keep Imported** — replace what's in the app.
- **Keep Both** — treat them as genuinely different things and keep a copy of each.
- Some mismatches carry a purple **“Possible Duplicate”** tag with a short explanation.
- Nothing is saved while you decide — choices live only in memory.
- **Save Changes** stays greyed out until **every** mismatch has a decision, so nothing is accidentally left unreviewed.

5. Excel Exports

- **Family export** — one workbook with tabs for Deposits, Post Office, Insurance and Mutual Funds, using the same columns, in the same order, as each section's own export. Dates are real Excel dates, so filtering and sorting work.
- **Dashboard exports** — each dashboard exports its filtered table, with a dropdown list built into the category or type column.
- **Rolodex export** — a single “Rolodex” tab with name, company, role, phone, email, notes and date added, sorted alphabetically.
- All exports share one consistent look: a light-grey header row, a matching TOTAL footer where relevant, and a day-month-year date format.

6. A Hidden Utility

The app also contains a hidden, unlisted utility screen with no button or menu entry anywhere. It is opened by a **secret way** that is intentionally not documented here. It can password-protect or unlock ordinary spreadsheets, and can convert backup files to and from readable spreadsheets.
