💰 Premiums

⌚ Maturity

📊 Dashboard

1. What One Policy Records

The form uses the same terms an Indian policy document uses — Date of Commencement, Date of Maturity, Sum Assured, Nominee — so filling it in feels like copying from the paper. **Only the policy number is required**; everything else can be added as it becomes known.

Policy number	The one mandatory field
Insurer · Type	e.g. LIC, HDFC Life · Life, Term, Endowment, ULIP, Health, Motor, or Other (with a free-text box)
Dates	Commencement, maturity, and last premium due
Payment frequency	One Time, Monthly, Quarterly, Half-Yearly or Yearly
Premium	Amount per payment (or the whole single premium)
Sum assured	What is paid out — different from the premium that goes in
Extended term	Cover continuing past maturity: none, until a date, or for life
Nominee	A family member or a typed name
Top-ups	A history of extra premiums, each with its own amount and date
Status	Payment Due or Due Completed — worked out automatically

Special cases handled cleanly

- **Whole-of-life plans** never mature on a fixed date, so a “Life” setting stands in for a maturity date.
- **Single-premium policies** have no recurring “last due date”, so a “Single” setting stands in and frequency is fixed to One Time.
- **Extended term** has three possible situations (none / until a date / for life), captured by three linked settings.

- **Top-ups** sit on top of the original premium like sticky notes: the base figure never changes, and each extra payment keeps its own history.

2. A Member's Policy List

Opened from a member's Insurance tile. It shows total policies, total premium and how many are due, highlights whichever policy needs attention soonest, and lists policies sorted so the most urgent is first.

Status is never just what was typed in

A typed-in status goes stale — nobody comes back to flip it the day a final payment passes. So the app works out the real status fresh each time: a single-premium policy completes the day after its one payment date; a recurring policy completes once its last due date has passed, or as soon as a top-up covering that final stretch is logged — whichever comes first. A stored value may be upgraded to Completed but is never downgraded automatically.

"Ext" instead of red. A policy that has matured but is still under an extended term shows a quiet "Ext" label rather than a red alert, because its cover hasn't actually run out.

3. The Add / Edit Form

- **Status is a read-only preview.** It used to be editable; now it is calculated from the other fields using exactly the same rules as the policy list, so a policy can't be left showing the wrong status.
- **Next Due Date and Total Premium update themselves.** They are derived from frequency, commencement date, last due date and logged top-ups — never typed — so changing any of those, or logging a payment, moves both figures immediately.
- **One dropdown instead of a mode switch.** Maturity, Last Due and Extended Term each offer a real date *or* a special option. Each is a single tappable dropdown: choose "Pick date" and the same popup becomes a calendar, and the field then shows the chosen date.
- **Premium Payments popup** for logging top-ups.

4. The Insurance Dashboard

Part	What it offers
Filters	Family member(s), policy type(s), and a From / To range on commencement date
Insights page	Rotating alert card for premiums due and policies maturing, plus a calendar showing both Premium Due days and Maturity days
Summary Table page	A detailed list of every filtered policy
Excel export	Through the Share menu, with an in-cell dropdown

Sharing the rules, not copying them

Status and next-premium logic were once re-implemented on the dashboard and quietly drifted from the real rules. The dashboard now calls the very same shared functions the policy list uses, so it can never show a different answer for the same policy.
