1. What One Deposit Records

A deposit is the digital version of one bank FD / RD receipt:

Account / receipt number	Shown as “#1234”
Principal	For a Fixed Deposit, the amount put in. For a Recurring Deposit, the per-instalment amount
Interest rate	Annual percentage, for reference
Start date · Maturity date	When it began and when it is due
Maturity value	What it will be worth when it matures
Type	Fixed or Recurring
Scheme	Optional plan name, such as “Tax Saver FD”
Nominee	Either a family member or a typed name — never both
At maturity	Renew principal and interest · Renew principal · Do not renew
Interest payout	On maturity · Monthly · Quarterly
Instalment frequency	Recurring only: Weekly, Monthly, Quarterly or Yearly
Closed	True once withdrawn, closed or renewed away

2. The Bank’s Deposit List

- **Three summary boxes** — Total Deposits, Principal and Maturity Value. They count only deposits that are open **and** not yet matured, because a matured deposit has effectively cashed out.

- **One “Next Up” card** — whichever single date, across every deposit and both kinds of date (maturity and instalment), is genuinely soonest. When it is dealt with, the next in line takes its place.
- **Deposit cards** — collapsed (essentials only) or expanded (every detail plus a maturity progress bar).
- **Edit mode** — a pencil reveals edit options on each card.

The Recurring Deposit puzzle

No “paid so far” total is stored. Because the amount entered is per instalment, the app counts how many instalment dates have already passed (stepping forward from the start date at the deposit’s own frequency) and multiplies by the instalment amount. The same counting drives the calendar on the dashboard, so totals and calendar can never disagree.

3. Adding or Editing a Deposit

One form handles both, including a Delete option when editing. It also contains a compact calendar for picking dates and a **years / months wheel** for Recurring tenures.

- **Estimated maturity value.** As soon as amount, rate, start and maturity dates are filled in, the form estimates the maturity value using the standard quarterly-compounding approach banks commonly use. It is a helpful guess, not gospel: the moment you type your own figure, auto-estimating stops and your number is trusted until the box is cleared.
- **Recurring deposits.** The “principal” box really means the monthly (or weekly / quarterly / yearly) amount, so the estimate first adds up all instalments over the tenure and then applies the same formula — a simplified stand-in for how RD interest works.
- **Tenure instead of a date.** For Recurring deposits the Maturity Date field is replaced by a years / months wheel; the maturity date is then start date + tenure behind the scenes.
- **Duplicate protection.** Saving is refused, with a clear message, if the account number already belongs to another deposit at the same bank.

The form never writes to storage itself; it hands the result back, and the bank list saves the whole member once the person returns.

4. The Deposits Dashboard

A read-only, family-wide report over every deposit in every bank.

Part	What it offers
Filters	Family member(s), bank(s), deposit type(s), and a From / To range on start date
Insights page	Rotating alert card for upcoming maturities, principal leaderboard, bank breakdown, status charts and a maturity calendar

Part	What it offers
Summary Table page	A detailed list of every filtered deposit
Excel export	Everything exportable as an .xlsx file through the Share menu, including a dropdown list inside the type column

- **Banks are grouped by name.** Two members who each have a bank called “SBI” are treated as one “SBI” line for filtering, summaries and exports; stray spacing and capital letters are ignored when comparing names.
- **Dropdown in Excel.** The spreadsheet library cannot add an in-cell dropdown on its own, so after the file is built it is carefully adjusted, with safety checks that fall back to the plain, working file if anything goes unexpectedly.
