1. What One Entry Records

Post Office passbooks are filled in gradually and not every one looks the same, so — like insurance — **only the account number is required**. Most text fields are free-typed.

Office / branch	Free text (with suggestions from past entries)
Scheme type	PPF, NSC, RD, KVP, SCSS, TD, MIS, SB, PLI, RPLI and others
Customer ID · Account number	Free text
Frequency	One Time, Monthly or Yearly
Amount	Per instalment, or the one-off amount
Start date · Maturity date	Maturity is optional
Due-day pattern	Which day of the month (and which month, for Yearly)
Sum assured · Last instalment date	Mainly for PLI / RPLI policies
Top-ups	Extra amounts paid beyond the original deposit
Nominee	A family member or a typed name

2. A Member's Post Office Page

- **Three headline numbers** — active (not-yet-matured) deposits, total actually paid in so far, and how many are recurring schemes.
- **“What’s next” alert** — the soonest of any instalment due date or maturity date across all entries, even if that date has already passed.
- **Entry cards** — a compact one-line row or a full detail card, switched with Expand / Collapse.

- **Suggestions from everyone.** Autocomplete lists for branch names, scheme types, customer IDs and account numbers are built from entries across **all** family members, so something typed once for one person is suggested when logging an entry for another.
- **Edit mode** via the pencil next to “POST DEPOSITS”, and a Dashboard button.

3. Adding or Editing an Entry

One form for both, with Delete when editing. It never saves directly; it hands the finished entry back to the screen that opened it.

The “auto-pay” idea

A real Post Office RD or PPF doesn’t need every monthly or yearly instalment typed in. Once the due-day pattern is set, every cycle that has already arrived on the calendar — including the current one — is assumed paid at the usual amount. A small notes icon next to Amount opens a **Payments** list of those elapsed cycles purely so any one can be corrected if it settled for a different amount. There is no separate “add a payment” step.

4. Working Out “What’s Due Next?”

Much of the logic exists to answer one question well: for a recurring entry, what date is the next payment actually due?

- An entry can be years old; the pattern must always point to the next **real, upcoming** date, not one in the past.
- Once an instalment is paid, the pattern jumps forward to the next cycle — whether paid early, on time, or several cycles behind.
- Nothing is ever shown as due **after** an account has matured, except the final legitimate instalment that falls exactly on the maturity date.

5. The Post Office Dashboard

Part	What it offers
Filters	Family member(s), deposit type(s), and a From / To range on start date
Insights page	Rotating alert card for due instalments and entries maturing, plus a calendar showing Due Date days and Maturity days — including when both land on the same day, such as an RD’s last instalment in its maturity month
Summary Table page	A detailed list of every filtered entry
Excel export	Through the Share menu, with an in-cell dropdown

The rules for overdue, due soon and fine live in one shared place, so this dashboard can never disagree with a member's own Post Office page.
