

Work — Rolodex & Certificates

A contact book and a licence tracker that warns before anything lapses

 Rolodex

 Folders

 Certificates

 Reminders

1. Rolodex — The Work Contact Book

Opened from the Work tile. Each contact is a card like an index card in a real rolodex.

Name	The only required field
Company · Role	Optional; shown together on the list as “Company · Role”
Phone · Email	Optional; kept as typed because phone formats vary — the app only shows and copies them
Notes	Free text, such as “met at the Pune expo, handles procurement”
Added on	Used to break ties when sorting alphabetically

- The list is **alphabetical** by name, with a search box that filters by name, company or role as you type.
- Small **copy buttons** beside each phone number and email put it on the clipboard and confirm with a brief message.
- One form handles Add and Edit; Delete appears only when editing, after a confirmation.
- A contact with nothing but a name shows a gentle “contact details missing” hint — the card is never hidden.
- The whole Rolodex can be exported to a one-tab Excel sheet.
- It is a plain, unlocked list — ordinary contact details, not secrets.

2. Certificates — Folders

The tracker’s front page is a set of named **folders**, usually one per person (“Ramesh”, “Priya”), but any label works (“Office Vehicles”). Folders can hold **subfolders**, so “Ramesh” can contain “Vehicles” and “Professional”. The same screen is reused one level deeper each time a folder is opened.

- A coloured **corner badge** flags if anything anywhere inside a folder, including its subfolders, is overdue (red) or inside its reminder window (yellow).
- A folder can hold both subfolders and its own certificates; subfolders are listed first, then its own certificates, soonest-to-expire first.
- The “+” **button** offers **Add New Folder** (inside whatever is open, or at the top level) and **Add Certificate** — but only once a folder is open, since otherwise there is nowhere to file it.
- A folder’s menu offers **Rename**, **Move to...**, **Copy to...** and **Delete**. Deleting a folder also removes every subfolder at any depth and every certificate inside.

3. A Certificate

Name	Required, e.g. “Fire Safety Certificate”, “Driving Licence”
Date acquired	When the real-world certificate was issued
Validity	A count and unit — Weeks, Months or Years (e.g. “2 Years”)
Expiry date	Starts auto-calculated from acquired date + validity, but is a real saved field you may override
Reminder	How far before expiry to start warning — a count and unit (Weeks, Months, Quarters or Years)
Repeat	Whether the reminder keeps repeating until the certificate is renewed rather than flashing once
Folder · Created	Which folder it is filed in, and when the record was added

Auto-fill versus manual override

Expiry starts out calculated each time you change the acquired date or the validity — until you tap the Expiry Date field and pick a date yourself. From then on it is treated as a deliberate correction and is no longer silently recalculated, even if validity changes. An **Auto-calculate** link lets you go back to the automatic value. Editing an existing certificate starts in the manual state, since what was saved may already have been hand-corrected.

This is different from most dates in the app (deposit maturity, premium due dates), which are never stored and are worked out fresh every time. Expiry is stored precisely so that a manual correction sticks.

Calculating backwards for the reminder date handles month ends carefully: if a day doesn’t exist in the target month, it is clamped to the month’s last day, and going back from January correctly lands in December of the previous year.

4. The Certificate List

Each folder's certificates are shown soonest-to-expire first as cards with acquired and expiry dates, validity length and reminder setting, with the same red / yellow corner badge. Add and Edit use one form; Save or Delete is handed back to the list, which stores it.
