Dashboard

1. The Work Section

Work is a landing page of square tiles reached from Home: **Generate Invoice**, **Rolodex** and **Certificates**. It isn't one of the five footer sections, so the footer shows with nothing highlighted — but every footer button still navigates normally.

Generate Invoice itself is a small page with two buttons: **Generate New Invoice** and **Edit Invoice**.

2. The New Invoice Wizard

A guided five-step flow, like filling in a paper timesheet and invoice packet. The back button steps back one screen at a time instead of leaving the flow.

Step	What you do
1. Invoice Type	Choose the kind of billing period: a single Day , several Days , a Week , a Month , a Quarter or a Year
2. Period	Pick exactly which dates — from a calendar for Day / Days / Week, or a tile grid for Month / Quarter / Year
3. Timesheet	For every date, mark it worked or Off and set start and end times (hours are calculated for you). Time and date cells open a compact calendar dropdown and a tap-the-dial analog clock anchored under the tapped cell. A single Day has no “Off” option
4. Billing Details	Who is billing whom (From and To), bank details for payment, the invoice number, bill date, hourly or daily rate and currency
5. Summary	A recap of everything, with the total worked out as hours × rate, before generating the invoice

Turning two clock times into hours

Usually it's simple subtraction — 9:00 AM to 5:00 PM is 8 hours. An overnight shift (10:30 PM to 4:00 AM) has an end time that is earlier on the clock than the start, even though it really ends the next day. When the end isn't later than the start, the end is rolled into the next day, so an overnight shift still comes out as a normal positive number of hours.

Choosing **Save and Generate PDF** stores the invoice and produces a PDF whose "TIME SHEET" heading uses a bundled bold serif font.

3. What a Saved Invoice Contains

- The billing period type and only the date fields that type needs.
- The full day-by-day timesheet: worked or off, and start and end times.
- Which weekdays are "off" by default (such as weekends).
- The From details, bank details and To (client) details.
- Invoice number, bill date, rate and currency.
- Created and last-edited times.

Total hours and the amount to bill are always computed from the timesheet and rate, not typed separately, so they always match what is on the timesheet.

4. Edit Invoice — A Filing Cabinet

- Every saved invoice is grouped into a **folder per client**; invoices with no client land in "No client set". Inside a folder, the newest bill date comes first; folders are ordered by most recent activity.
- Tapping an invoice reopens the wizard **pre-filled**, so it can be changed and re-saved — overwriting the original rather than creating a duplicate.
- The trash icon deletes an invoice after a confirmation.
- A bar-chart icon beside the search box opens the Invoice Dashboard.

A smarter search box

Searching matches more than client names. Typing "Mar" also finds invoices billed in March; typing a sender's name finds what they sent; a year or a period label such as "Q2" works too. Each invoice gets a single searchable block of text combining those. While searching, every folder with a match opens automatically; clearing the search restores whichever folders you had opened by hand.

5. The Invoice Dashboard

A read-only view over the invoices already loaded by Edit Invoice — it never reaches back into storage, matching every other dashboard in the app.

Part	What it offers
Filters	A multi-select client filter (empty means all) and a From / To range on bill date
Insights page	Stat tiles (invoice count, working days), total billed per currency, an Hours Trend chart you can zoom from daily to weekly, monthly, quarterly, half-yearly and yearly, and a Top Clients breakdown
Summary page	A per-client table (invoice count and billed total per currency, with a TOTAL row) and a Work Days Summary that drills down from year to quarter to month to day

Spreading a monthly invoice across days

An invoice has one total for a whole period, but charts need “earned per day”. With no per-day rate stored, the dashboard splits the total evenly across every working day in that invoice’s timesheet — a 3,000 invoice over 20 working days counts as 150 a day for charting only. This never changes the real saved amounts.
